

Single-component casting – high-carbon MEYLE-PD brake disc with full-surface coating to protect against corrosion!

High-performance MEYLE-PD brake disc for new and common BMW models

Brilliant aesthetics that stand the test of time

MEYLE has opted for a single-component brake disc for BMW applications in order to ensure resistance to oxidation and corrosion. Unlike other manufacturers which produce brake discs made from a combination of aluminium bell and cast-steel friction ring, the MEYLE-PD brake disc is manufactured from a single steel casting, which makes it possible to coat the entire surface of the brake disc and prevent corrosion. The result: long-lasting, brilliant aesthetics.

Powerful performance in a new look

As one of the leading manufacturers of automotive spare parts, MEYLE takes its responsibility very seriously: MEYLE brake discs are of course tested and certified in accordance with the ECE R90 quality standards and thus conform with the most stringent safety standards and OE parameters. With the new MEYLE PD brake disc, MEYLE offers once again a reliable brake partner for optimal performance – even in the new design.

High carbon – high class

The high-carbon MEYLE-PD brake discs are more heat-resistant than conventional discs: a higher percentage of carbon makes the brake discs more torsion-resistant. They can withstand higher temperatures and prevent thermal vibrations. Even in the new design, this reduces noise and oscillations, whether in everyday or extreme situations.

You can find an overview of currently available and planned references, including vehicle applications, on the next page
